#### Abstract

The crystal structure of the compound $\mathrm{C}_{20} \mathrm{H}_{24} \mathrm{~N}_{2} \mathrm{O}_{24}$ was determined by direct methods. The crystals are monoclinic, space group $\mathrm{P}_{1} / \mathrm{n}$, and unit cell parameters are: $\mathrm{a}=10.2342$ (9), $\mathrm{b}=4.8763$ (5), $\mathrm{c}=19.3578$ (11) $\mathrm{A}, \beta=98.9632(10)^{\circ}, \mathrm{V}=956.6$ (5) $\mathrm{A}^{3}, \mathrm{Z}=2, \mathrm{D}_{\mathrm{c}}=1.239 \mathrm{grm}^{-3}, \mathrm{D}_{\mathrm{m}}=1.22 \mathrm{grm}^{-3}$. The final Rfactors are converged to $\mathrm{R}=0.059$ and $\mathrm{R}_{\mathrm{w}}=0.056$ for 553 independent observed reflections. The molecules are linked by van der Waals forces and an intramolecular hydrogen bond is present between $\mathrm{O}_{2}$ and $\mathrm{N}_{1}$ atoms. The ring system displays a deviation from planarity.

Keywords - Crystal structure, salen, schiff bases, salicyladi-mine

## 1. INTRODUCTION

The ability of Schiff bases derived from salicylaldehyde as poly-dentate ligands to form very stable complexes with different cations is well known [1]. Their complexes have been known since the midnineteenth century [2], and before the general preparation of Schiff base ligands themselves [3]. Transition metal complexes of Schiff base ligands have contributed significantly to the development of transition metal chelate chemistry [4-7], and complexes of these ligands with some cations play a major role as speculative models in bio-inorganic chemistry, enzsymatic studies [8] and selective membrane electrodes [9].

In this paper we report the molecular structure of a new Schiff base, $N, N^{\prime}-3,6$ - dioxa-1, 8 octanebis (salicylaldimine) in order to investigate the nature of molecular conformation and chemical bondings.

## 2. EXPERIMENTAL

## - Synthesis of Schiff Base 46:

2, 2- [3, 6-Dioxa-1, 8-octandiylbis (nitrilomethylidyne)]-bis-phenol (46): A solution of 1, 8-diamino3, 6-dioxaoctan ( $0.01 \mathrm{~mol}, 1.48 \mathrm{~g}$ ) in methanol ( 15 ml ) was added to a solution of salicylaldehyde $(0.02 \mathrm{~mol}, 2.44 \mathrm{~g})$, in methanol $(10 \mathrm{ml})$. The reaction mixture was then refluxed with stirring for about 15 hours. The mixture was cooled and the solvent was evaporated to give a yellow oil, which

[^0]was crystallized by petroleum ether (60-80 C) to give 2 , 2 -[3, 6-dioxa-1, 8 -octandiylbis (nitrilomethylidyne)] -bis-phenol 46 as yellow crystalline solid in $94 \%$ yield ( 3.34 g ) . m. p. $=46 \mathrm{C}, \mathrm{R}_{\mathrm{f}}=$ 0.56 (n-Hexane- $\left.\mathrm{CH}_{3} \mathrm{OH} / 94: 4\right)$; ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 250 \mathrm{Mhz}\right) \delta 3.59(\mathrm{~s}, 4 \mathrm{H}), 3.71(\mathrm{~s}, 8 \mathrm{H}), 6.87(\mathrm{dt}, 2 \mathrm{H}$, $\mathrm{J}_{1}=7.5 \mathrm{~Hz}, \mathrm{~J}_{2}=1.0 \mathrm{~Hz}$, $6.93(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=8.25 \mathrm{~Hz}), 7.23(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=1.5 \mathrm{~Hz}), 7.26\left(\mathrm{dd}, 1 \mathrm{H}, \mathrm{J}_{1}=3.25 \mathrm{~Hz}\right.$, $\left.\mathrm{J}_{2}=1.5 \mathrm{~Hz}\right), 7.31\left(\mathrm{dd}, 2 \mathrm{H}, \mathrm{J}_{1}=7.25 \mathrm{~Hz}, \mathrm{~J}_{2}=1.63 \mathrm{~Hz}\right), 8.32(\mathrm{~s}, 2 \mathrm{H}), 13.39(\mathrm{~s}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}\left(\mathrm{CDCl}_{3}, 62.9\right.$ $\mathrm{MHz}) \delta 59.01,70.56,96.12,116.97,118.65,131.31,132.17,161.19,166.36$; IR (KBr), $650(\mathrm{~m})$, $742(\mathrm{~W}), 765(\mathrm{vs}), 850(\mathrm{~s}), 870(\mathrm{w}), 925(\mathrm{~m}), 970(\mathrm{~m}), 1040(\mathrm{~s}), 1062(\mathrm{~s}), 1125(\mathrm{vs}),. 1162(\mathrm{~s}), 1235(\mathrm{~m})$, $1255(\mathrm{w}), 1280(\mathrm{~s}), 1325(\mathrm{~m}), 1342(\mathrm{~m}), 1408(\mathrm{w}), 1450(\mathrm{~s}), 1470(\mathrm{~m}), 1500(\mathrm{~m}), 1510(\mathrm{~s}), 1587(\mathrm{~m})$, 1615(m), 1645(vs.), 2890(s), 2920(s), 3020(m), 3450(br, s) $\mathrm{Cm}^{-1} ; \mathrm{Ms}, \mathrm{m} / \mathrm{z}=358\left(\mathrm{M}^{+}+2,3.5\right), 357\left(\mathrm{M}^{+}\right.$ $+1,12.6), 356\left(\mathrm{M}^{+}, 23.2\right), 210(23.0), 192(18.9), 164(19.4), 150(18.0), 149(72.1), 148(41.3)$, 135(53.1), 121(44.3), 107 (base peak), 91 (25.4), 78 (24.3), 77(74.8), 65(33.7), 51 (38.5), 43(24.0), 41(19.1); UV ( $\mathrm{CHCl}_{3}$ ): $\lambda_{\text {max }}(\varepsilon), 258$ (33160), 313 (11787), 406 (680) nm.

Crystals of the $\mathrm{C}_{20} \mathrm{H}_{24} \mathrm{~N}_{2} \mathrm{O}_{24}$ suitable for x-ray analysis were grown from a concentrated ether solution using a slow evaporation technique. The $\mathrm{D}_{\mathrm{m}}$ was measured by flotation.

Numbers in parentheses are estimated standard deviations in the least significant digits
The geometry of the molecular structure indicates that the molecule as a whole has an inversion center (c) between $\mathrm{C}_{10}-\mathrm{C}^{*}{ }_{10}$ bond, and therefore lie on special positions with two formula units per unit cell (Fig 1). The ring system has average bond lengths and bond angles of $1.41(2) \mathrm{A}^{\circ}$ and $120(1)^{\circ}$. The $\mathrm{C}_{1}-\mathrm{C}_{2}-\mathrm{C}_{3}$ and $\mathrm{C}_{1}-\mathrm{C}_{6}-\mathrm{C}_{5}$ bond angles are smaller than the average value. The $\mathrm{C}_{6}-\mathrm{C}_{7}$ bond length of 1.49 (1) $\mathrm{A}^{\circ}$ can be considered as single $\mathrm{C}_{\left(\mathrm{SP}^{2}\right)}{ }^{2}-\mathrm{C}_{\left(\mathrm{SP}^{2}\right)}{ }^{2}$ bond distance. A calculated least square plane through ring system displayed a deviation form planarity, and was found to adopt a puckered conformation: The maximum out- of- plane deviations are $-0.59,-0.5,0.54$ and 0.68 A for $\mathrm{C}_{1}, \mathrm{C}_{6}, \mathrm{C}_{3}$ and $\mathrm{C}_{4}$, respectively.

In this molecule, $\mathrm{C}-\mathrm{O}$ bond lengths are of two different types. $\mathrm{O}_{2}-\mathrm{C}_{10}$ and $\mathrm{O}_{2}-\mathrm{C}_{9}$ bond lengths are comparable [1.46(1) and $1.47(1) \mathrm{A}^{\circ}$, respectively], while $\mathrm{O}_{1}-\mathrm{C}_{1}$ is significantly shorter [1.37(1) $\mathrm{A}^{\circ}$ ]. The latter is similar to those of some double bond characters reported by Tenon et. al [10], and Ondracek et al [11]. The N-C bond lengths around N are very dissimilar [1.29(1) $\mathrm{A}^{\circ}$ and $1.49(2)$ $\left.A^{\circ}\right]$. The $N_{1}-C_{7}$ is typical of a double bond and $N_{1}-C_{8}$ is single. These values are in agreement with those reported elsewhere [11-13]. Therefore the chain is likely to correspond to $\mathrm{C}_{6}-\mathrm{C}_{7}=\mathrm{N}_{1}-\mathrm{C}_{8}-\mathrm{C}_{9}-\mathrm{O}_{2-}$ $\mathrm{C}_{10}$, and approximately adopts the extended conformation. All other bond lengths and angles are within the expected ranges.

The compound is stabilized by an intramolecular hydrogen bond distance of 2.601 A between $\mathrm{O}_{1}$ and $\mathrm{N}_{1}$ atoms. All intermolecular contacts correspond to normal van der Waals interactions.
